Ligero

Efficient Content Delivery and Integration

Do you have to make legacy repository content available on intranets and external websites?
Do you need tighter security around your web content? Do you need to reduce
disk storage requirements of your websites? If your organization is in need of
a new approach to integrating content management systems with
intranets or external websites, then Ligero is right for you.
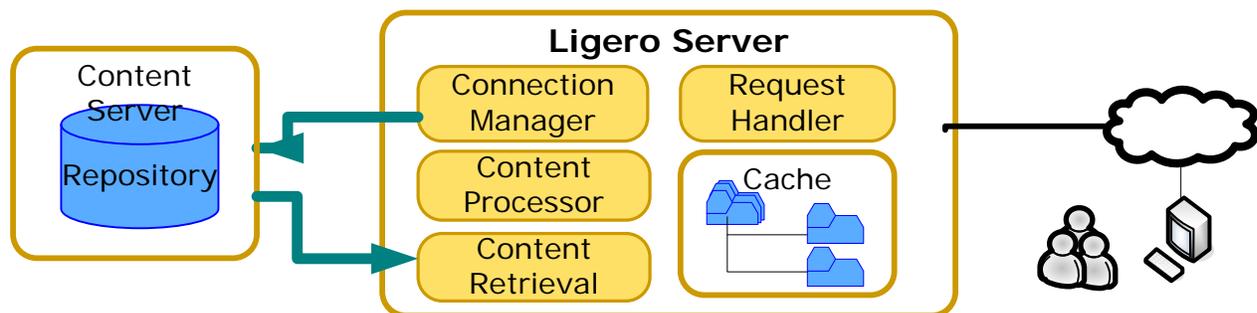

Introducing Ligero

Organizations challenged with making content from legacy repositories available on intranets and external websites often struggle with traditional publishing tools. Armedia's Ligero offers a fresh approach to the challenges of integrating content management systems with web, portal and enterprise applications. Ligero changes the publishing model by serving new content directly from a repository to a caching server, eliminating the need to publish files. It can then be configured to cache content for efficient delivery according to security and business policies.

How Ligero Works — Ligero flips the paradigm of caching content by replacing the old 'push' publishing methodology with new 'pull' technology. Only pulling and caching the most frequently accessed content, Ligero eliminates the need to publish files and reduces storage requirements. Ligero can also be configured to cache content for efficient delivery according to security and business policies. Through load balancing, preemptive caching of critical content, and other techniques, Ligero will reduce any risk created by depending on the repository to bring you the most effective content display possible.

Ligero for Documentum RightSite - Ligero enables users to upgrade their repositories, while continuing to use the RightSite tagged content, with little or no modification. Another option is Ligero LiteSite Converter, which runs against legacy HTML content and converts it to Ligero compatible JSP. With Ligero, your organization can move environments forward with much needed upgrades, without the burden of complex rewrites of your content or changes to downstream applications.

Ligero for Documentum WebPublisher - Armedia's Ligero Server makes it possible for you to eliminate the push of content to preview and staging sites, significantly reducing processing time and the number of copies of content stored in your pre-production sites. By deploying Ligero, you can eliminate the need for complex server farm installations without losing any of the core benefits of caching serves.
