

# Armedia Caliente

## Data migration giving you a headache?

Do you need to migrate content from legacy repositories into a new repository? Is mapping the content and metadata taking more time than you and your IT team would like? If you need to move content and/or metadata from an ODBC compliant database, file system, or legacy content repository, Armedia Caliente ("Caliente") is for you.

## What is Caliente?

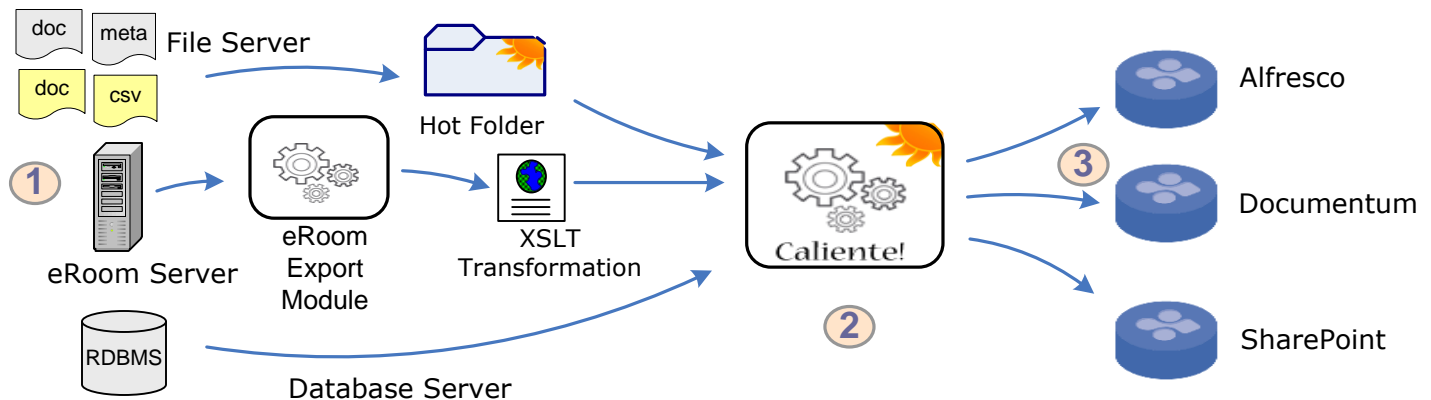

Caliente is a completely customizable content migration utility, designed specifically for large scale content migrations. Caliente has the ability to migrate to and from various different electronic formats, including but not limited to, ODBC compliant databases, EMC Documentum, SharePoint, Alfresco, eRoom and even hot folders.

## What does it do?

At its core, Caliente provides simple file system-based workflows which contain tasks that interact with different repositories. The most popular application of Caliente enables the automatic import of content and metadata. Caliente also provides a framework for extension and customization to add tasks that may include interaction with other systems in addition to EMC Documentum. Thus, Caliente provides an open and versatile foundation for building custom integrations with EMC Documentum, SharePoint and Alfresco.

### At a Glance: Armedia Caliente Multi-Protocol Server Integration

Move content to the repository automatically from Email, FTP, and Messaging Servers

- 1 Information is read from the source locations (i.e. File System, eRoom, database or etc.)
- 2 Information is processed through the Caliente pipeline allowing for maximum flexibility.
- 3 Information is imported into the configured repository of choice.
